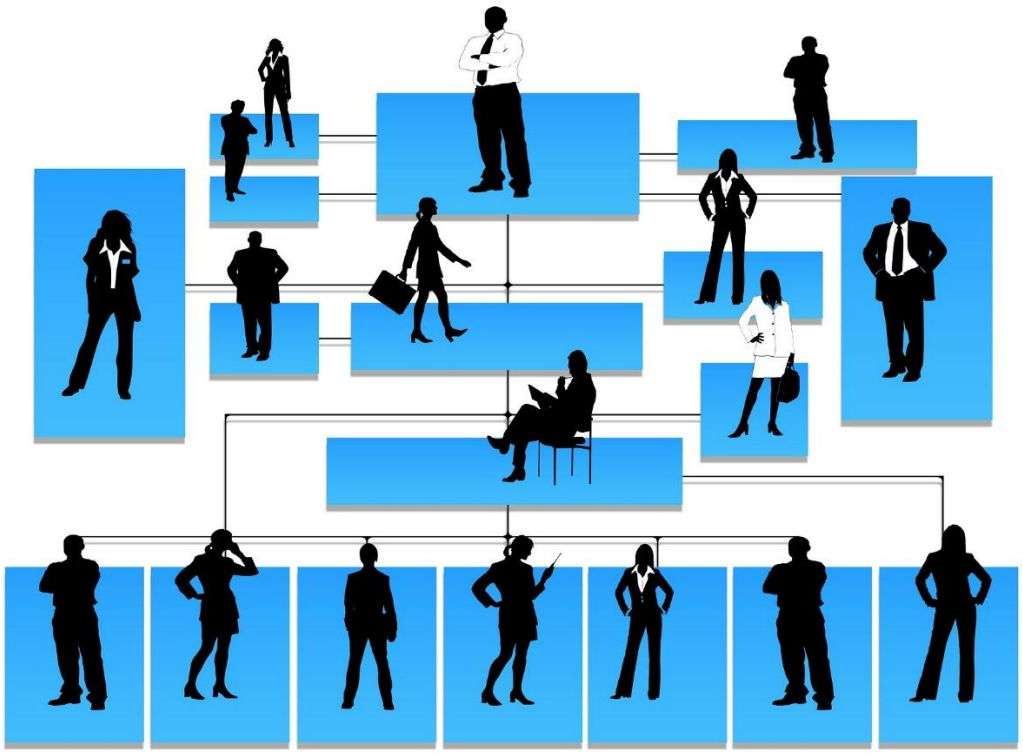
What is A Virtual Office?

According to The New York Times in 2016, 43% of working Americans said they spent some time working remotely. If you're picturing a stay at home Mom- in pajamas, sitting on the computer- think again. The majority of remote workers are frequent travelers working from the airport or their hotel rooms as well as Freelancers, part-time employees and Independent Contractors. Remote work is and will continue to be a growing trend. Employees gain flexibility and are able to have more of a work-life balance and companies see an increase in productivity and a decrease in expense. Technology has allowed remote employees to take their virtual office on the go. Keep in mind certain security measures should be taken to avoid a catastrophic business data breach.



Quick Setup

The quickest and easiest way to get setup for your employees to work remotely is to work with a Managed Service Provider who specializes in IT. Hiring a team who already has experience in setting up a virtual environment will not only deliver a speedy outcome but a reliable one, as well as offer you quick and easy on-going support. We can provide a remote solution fast. With the implications of the virus people need a setup and they need it now.

Must Have's

Besides the obvious musts like a quiet work area stocked with your supplies, you need to think of things like a strong, reliable, secure internet connection. You should have security protocols, a Disaster Recovery Plan as well as a Business Continuity Plan. Your employees will need reliable communication devices and the associated tools and apps for access to critical information perhaps your industry even must follow certain federal regulations and compliance laws. The easiest way to manage all the must have's is to hire a pro!

Security and Compliance Regulations

When you use a Managed Service Provider, you're getting the experience of a team. This team is already knowledgeable in cyber-security, ransomware protection and what compliance regulations and solutions are right for your industry. Most likely, they have already worked with clients who have setup a virtual office and know the steps that need to be taken to get your business up and running; out of the office buildings. The quick fix you found on the internet could be using illegal software and is probably not secure, with SkyView Technology you are guaranteed the correct implementation of firewalls, anti-virus and other security solutions.

How it's done.

We know the tools and to build the infrastructure to allow businesses to have any or all staff work from anywhere, including home. We can even do this without the need to purchase new hardware, simply by taking advantage of our cloud services expertise, that are closely monitored and maintained by a team of network and security professionals. This may include advanced security and federal compliance.
